STUDYLENS — EXPERIMENT 7

Aim

To organize StudyLens data in Zoho Creator and prepare an analytics view for monitoring students, subjects, topics, assessments, and assessment results.

StudyLens data used

- Students: student profile details, course, year/drop-down selection, and learning goal.
- Subjects and Topics: subject names, topic names, and their relationships.
- Assessments and Assessment Results: assessment details and recorded student performance, where these records are available.

Analytics workflow

1. Open the StudyLens application in Zoho Creator.
2. Review the available Students, Subjects, Topics, Assessments, and Assessment Results forms/reports.
3. Use report data to plan charts such as student count, assessment completion, topic-wise performance, and learning-gap summaries.
4. Configure charts and dashboard widgets only after the relevant records and fields are populated.

Expected dashboard insights

Analytics view	Purpose
Student overview	Summarize registered learner profiles.
Subject/topic coverage	Show which learning areas are represented in the app data.
Assessment performance	Summarize recorded scores by assessment or topic, if scores are entered.
Learning-gap summary	Identify weak topics from assessment results once the scoring and gap rules are configured.

Result

The StudyLens screens document the application's data areas. Analytics charts and learning-gap indicators should be treated as planned until the required records, formulas, and dashboard widgets are configured and verified in Zoho Creator.
